User Flag Importer

Modified on Thu, Jun 29, 2023 at 10:03 AM

User Flag Importer

What does it do?

The User Flag Importer scheduled task will scan a directory for CSV Files (Comma Separated Values) and import the data inside of them into Student User Flag fields.

Expected File Format

The file must be a CSV (Comma Separated Values) file.

The first row must contain headers. The actual header names are ignored during the processing of the file.

The first column must be the student id.

In this example; each row contains one student id, a user flag code and value to update. The user flag code MATH must exist in the **Setup -> Districts -> User Flags Codes** screen or it will not be imported. Y values will add the flags to the students while N will remove them

Example File 1

```
STUDENT_ID, USER_FLAG_CODE, USER_FLAG_VALUE
1234, MATH, Y
1235, STSANDY, N
1236, VERBAL, N
```

This will not affect files under doc management

Configuration Options:

Path on server to scan for files to import

The task will scan this directory for all files. For every file it finds; it will try to import it.

Delete File After Import

If this option is enabled; the file will be deleted from the directory after it has been processed.

If the file is not deleted; it will be processed over and over again until someone manually removes the file from that directory.
